## Introduction

Silverlink Platform is a growing network connecting traditional markets and businesses with cutting-edge technology and new generation tokens, smart contracts and the large spectrum of tools their platform can offer.

We are a platform that can help businesses to integrate automation by creating a customized Token backed by their value. In this way we create a high speed market reachable by their entire user base.

For more than 5,000 years gold and silver have been used as true money, and for centuries its value has not been decreased at all. Many people believe that crypto-currencies and/or Tokens, a newcomer in the international market, can compete as a store of value with metals such as gold or silver. Silverlink.io improves the features that made silver and gold a respected “store of value”, which is why we decided to merge the best of two worlds and bring an innovative physical silver-backed crypto Token. With Silverlink.io, the stability and reputation silver has held through the centuries is combined with the security, speed and reliability a crypto-currency can offer.

As Silverlink.io is the link between crypto-currencies and the international silver market, it is projected to grow into a large and decentralized platform for digital silver certificates trading.

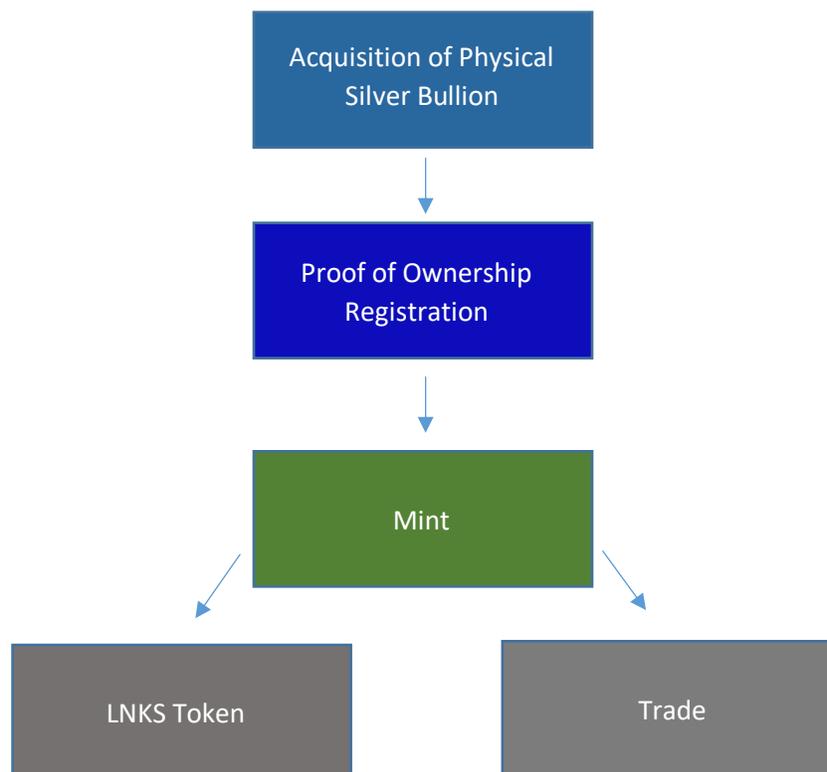

The platform offers a digital Token backed with real .999 physical silver to add a whole new level of security to modern crypto-currency trading. Physical silver will be acquired, transported, and stored with the highest levels of safety available.

## 1. Silverlink Token (\$LNKS)

LNKS Silver Token runs inside the Ethereum platform as a standard ERC20 token.

Link plans to offer several benefits by integrating physical silver into trading. The first is to reduce extreme downward volatility related to crypto-currencies, while the second is the promise to be the first choice among traditional silver users for making low-risk investments while simultaneously being inside the Ethereum protocol.

The mechanism Silver Link will use to perform its operations is described below:

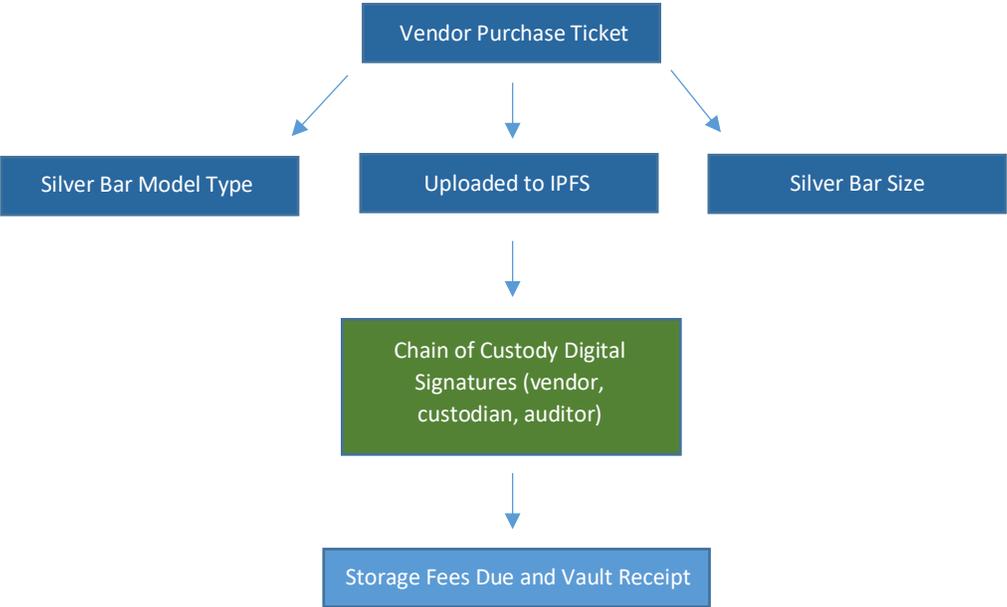

# 1.1 Acquisition of Physical Silver Bullion

Silverlink acquires 0.999 fine certified silver when a new buy order is triggered and paid by a user inside our platform. The silver is acquired from the lowest spot price available in markets with major silver producers such as:

- Australia
- China
- Peru
- Russia
- Mexico
- Chile

# 1.2 Proof of Ownership Registration

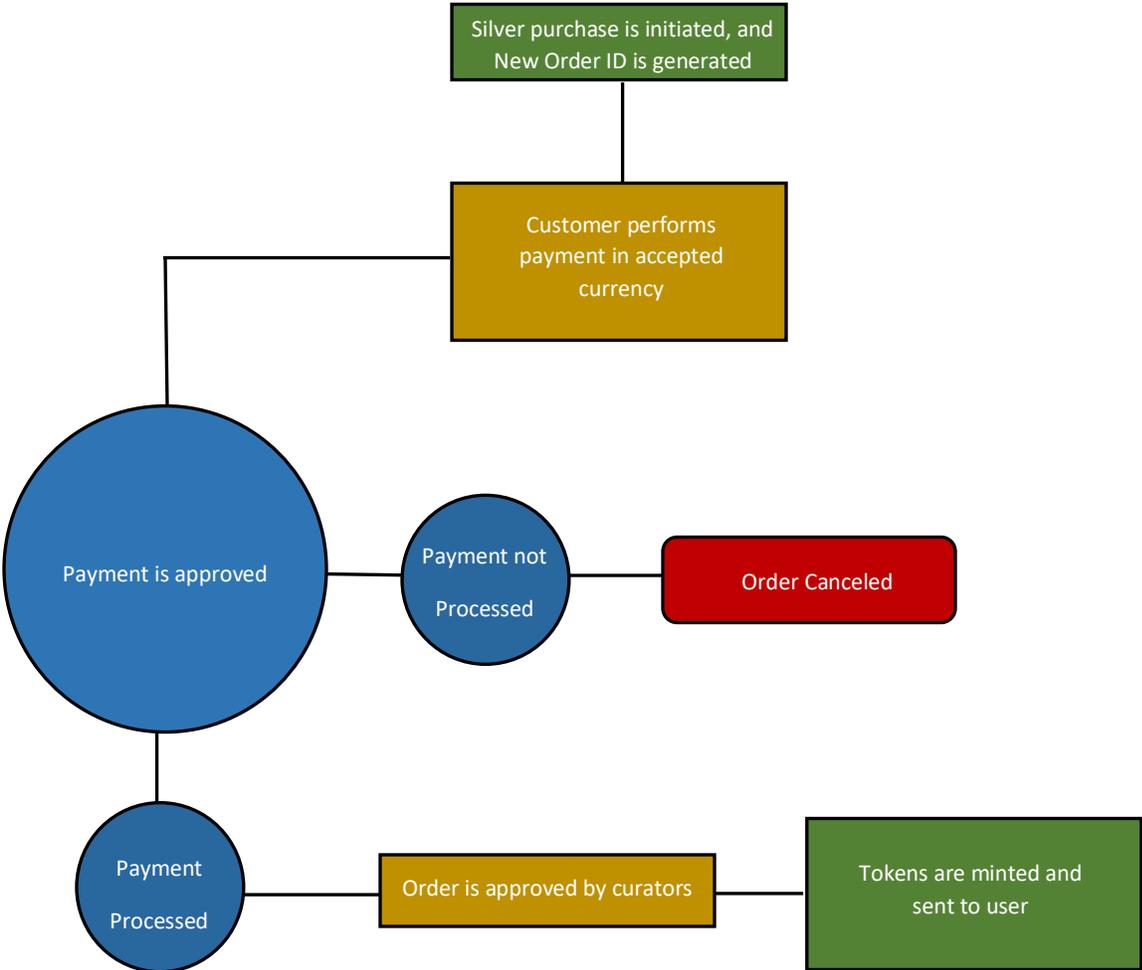

## 1.3 Mint of Silverlink Token

LNKS Silver Tokens are minted via a Minter Smart Contract, an ERC20 Token issuance automation. Each \$LNKS Silver Token represents 1g of silver and is divisible to 0.01g. For every Card that is sent to the Minter Smart Contract, \$LNKS Silver tokens will be issued in return. For instance, a 100g Silver Card sent to the Minter Smart Contract returns 100 \$LNKS Tokens to the provided address.

## 1.4 Trade of Silverlink Token

LNKS Silver Token is now fully tradable and secured into the network. Link Silver tokens are held in a wallet. At this point, a Silver LNKS Token can be sell, held, or redeemed at any point by the user. The exchange platform will charge a fixed fee on every \$LNKS buy order approved; this fee will entirely go into LNK holders. All trades are final in the network.

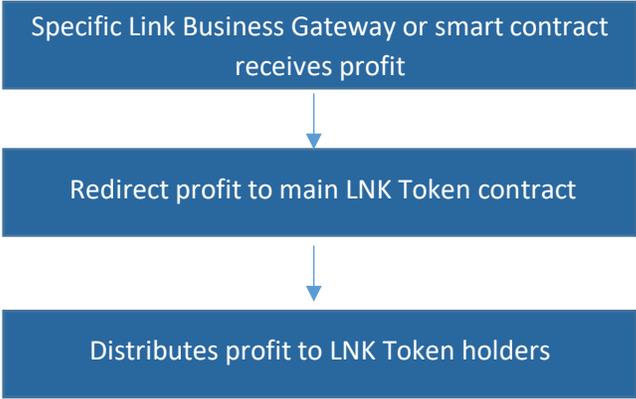

## 2. SilverLink Token Registration (\$LNKS)

## 2. 1 LNK Platform Token (\$LNK)

**LNK Platform Token Features are listed below:**

The main ERC20 Token from the Silverlink network, LNK is the currency of Silverlink, it is needed to receive dividends inside our platform. A proportional part of Silverlink profits is periodically distributed to LNK Token Holders via a snapshot taken every month, which means every LNK Token holder will receive a small part of LNK Platform token as a whole. The procedure is illustrated here:

Tokens fee like LNKS is directed to main Link Token Smart Contract.

### **3. Growth Plan**

Link Platform is aiming to acquire more metals to ensure a wide range of options for the end-user.

Our team will approach industry leaders in order to integrate new products to our platform with an initial high liquidity and to take advantage of the assessment skills and experience these established vendors/traders have.

The above is projected with the sole goal of accelerating precious metals tokenization, commodities, and fiat currencies into the network.

### **4. Business Gateway**

The intermediate and third step is to make LNK platform a necessity on a daily basis for every user in the new digital world.

Link Platform will position itself as a secure and fast trading gateway for metals.

### **5. Conclusion**

LNK Token works as the cornerstone of Silverlink platform, Link firm seeks to build a better world by offering new solutions, where finances are run by artificial intelligence, where anyone from any country can improve his or her life by taking advantage of smart contracts technology.
